WO 2001-US9231 A 20010323

AB The present invention is based on the sequencing and assembly of the Drosophila melanogaster genome. The present invention provides the primary nucleotide sequence of a large portion of the Drosophila

melanogaster genome in a series of genomic and predicted transcript sequences. This information is provided in the form of genomic, transcript and protein sequence information and can be used to generate nucleic acid detection reagents and kits such as nucleic acid arrays. Primary sequences are provided as contiguous strings in a computer-readable format and recorded on media such as floppy disks, hard disks, magnetic tape, CD-ROM, RAM, ROM and hybrids of these categories. Genes/exons can be predicted, sequences can be edited and homol. searches of target motifs can be conducted. [This abstr. record is one of ten records for this document necessitated by the large no. of index entries required to fully index the document and publication system constraints.]

AB The aim of this study was to elucidate the structure and possible function of colostrinin, also known as a proline rich polypeptide (PRP). The mol. wt. of colostrinin was originally detd. by gel filtration to be 17,200 daltons. In the presence of guanidinium chloride, however, the mol. wt. was found to be about 6,000 daltons. Further studies utilizing high-performance liq. chromatog. (HPLC) and mass spectroscopy revealed that colostrinin is a complex consisting of many low mol.-wt. polypeptides. A total of 32 peptides were isolated from the original colostrinin prepn. by HPLC and subjected to the N-terminal sequence anal. The results of sequence anal. revealed significant homol. of the peptides to three protein precursors: annexin, .beta.-casein, and a hypothetical .beta.-casein homolog. In addn., the sequence of several peptides showed no significant homol. to any specific protein in the current GenBank database. The synthetic peptides of various lengths representing the N-terminal sequence of the colostrinin peptides were made to study some biol. effects. Here we report that colostrinin and some of its component peptides are potent inducers of leukocyte proliferation and of certain

cytokines. Also, a series of monospecific antibodies were produced in rabbits against the synthetic peptides. The antibodies were used to study the kinetic of antigen redn. in colostrum and mature milk following lambing. A threefold decrease was common for most antigens studied over the period of 72 h. Based on the results of these studies we postulate that colostrinin represents a diverse group of peptides produced in the mammary gland of mammals for the development of the optimal physiol. responses in offspring. Also, it is hoped that the beneficial use of colostrinin in Alzheimer's disease, recently reported elsewhere, will revive interest in its clin. application for treatment and/or prophylaxis of many age-related disorders.

AB The fly *Drosophila melanogaster* is one of the most intensively studied organisms in biol. and serves as a model system for the investigation of many developmental and cellular processes common to higher eukaryotes, including humans. The nucleotide sequence was detd. of nearly all of the .apprx.120-megabase euchromatic portion of the *Drosophila* genome using a whole-genome shotgun sequencing strategy supported by extensive clone-based sequence and a high-quality bacterial artificial chromosome phys. map. Efforts are under way to close the remaining gaps; however, the sequence is of sufficient accuracy and contiguity to be declared substantially complete and to support an initial anal. of genome structure and preliminary gene annotation and interpretation. The genome encodes .apprx.13,600 genes, somewhat fewer than the smaller *Caenorhabditis elegans* genome, but with comparable functional diversity. Access to supporting information on each gene is available through FlyBase at <http://flybase.bio.indiana.edu> and through Celera at [www.celera.com](http://www.celera.com); the sequences are deposited in GenBank with Accession Nos. AE002566-AE003403. [This abstr. record is one of 4 records for this document necessitated by the large no. of index entries required to fully index the document and publication system restraints].
